About Us

PT. Calpadia Sistem Integrasi (CSI) is an Indonesian technology company headquartered in Jakarta, specializing in end-to-end Information Technology (IT) and Operational Technology (OT) solutions. We focus on transforming traditional businesses into digital enterprises by enhancing operational efficiency, collaboration, and data-driven decision-making.

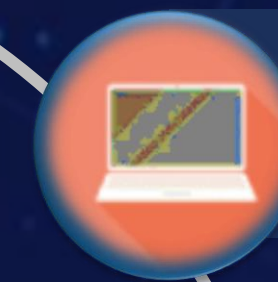

CSI's comprehensive IT services encompass Enterprise Content Management (ECM), Cybersecurity & DevSecOps, IT service management (ITSM), network infrastructure, and custom software development.

- Established since 2012
- Based in Jakarta, Indonesia
- Headcounts: > 30

PROJECT PORTFOLIO

OUR SOLUTIONS:

CyberSecurity & DevSecOps Solutions

ITSM, IOT, Network & Infrastructure

Digital Transformation & Enterprise Content Management

Custom Application Development & Support

Our Solutions

1. Cybersecurity & DevSecOps

Cybersecurity & DevSecOps Solution

We provide cybersecurity solution and integrating advanced cyber defense directly into the development lifecycle (SDLC). Through a Shift-Left Security approach, automated testing, and unified risk management, we ensure your business applications remain secure, resilient, and fully compliant with industry regulations from day one.

2. ITSM, IOT, Network & Infrastructure Management Solution

ITSM, IOT, Network & Infrastructure Management Solution

Our infrastructure, IOT and network solutions ensure peak operational efficiency, high availability, and minimal downtime. Based on ITIL standards, our services include 24/7 monitoring, workflow automation, and network optimization to support seamless, uninterrupted business operations.

3. ECM Digitalization & Collaboration Solution

ECM Digitalization & Collaboration Solution

We transform manual, paper-based workflows into secure, integrated digital ecosystems. Our ECM and collaboration solutions streamline document management, automate approval processes, and enhance cross-departmental communication to drive productivity, compliance, and faster decision-making.

4. Custom Application Development

Custom Application Development

We build tailor-made software solutions engineered specifically for your business goals. Utilizing Agile methodologies and modern cloud architecture, we deliver secure, scalable web and mobile applications with intuitive UI/UX to create a lasting competitive edge.

Cybersecurity & Devsecops Tools: Securing Your IT from Development Phase to Perimeter Security

SAST (Static Application Security Testing)

We provide SAST tool, which scans an application's source. It identifies the root cause of vulnerabilities and helps remediate the underlying security flaws. SAST solutions analyze an application from the "inside out" and do not need a running system to perform a scan. SAST tool will reduce security risks in applications by providing immediate feedback to developers on issues introduced into code during development.

DAST (Dynamic Application Security Testing)

We provide automated DAST solution that provides comprehensive vulnerability detection and helps security professionals and QA testers identify security vulnerabilities and configuration issues. It does this by simulating real-world external security attacks on a running application to identify issues and prioritize them for root-cause analysis.

MAST (Mobile Application Security Testing)

MAST tools help DevOps teams to identify and remediate security vulnerabilities in the mobile applications they build. MAST tools combine static and dynamic analysis, as well as automatic and manual testing methods, in order to detect vulnerabilities such as insecure data storage, insufficient encryption, and susceptibility to malware attacks, among others.

MOBILE APPS HARDENING

strengthens the defenses of mobile applications by utilizing techniques like Runtime Application Self-Protection (RASP) to actively monitor and block malicious activity, preventing tampering with the app and protecting sensitive data from unauthorized access or malware attacks; essentially making the mobile app more resilient against cyber threats

DATA MASKING

automatically identifies and replaces sensitive information in a database with realistic, fictitious data, effectively protecting confidential details while still providing usable test data for development, testing, and other non-production environments;

DATA TOKENIZATION

a data protection method where sensitive information like credit card numbers are replaced with random, meaningless "tokens" that can be used in applications while the original data remains hidden and secure, effectively minimizing the risk of exposure in case of a breach.

THREAT INTELLIGENCE & THREAT HUNTING

Threat intelligence is the process of collecting and analyzing information about existing cyber threats, including adversary tactics, techniques, and procedures (TTPs). It provides the "what to look for." Threat hunting is the proactive, human-led search for those hidden adversaries within a network, operating on the assumption that some attacks have evaded automated detection.

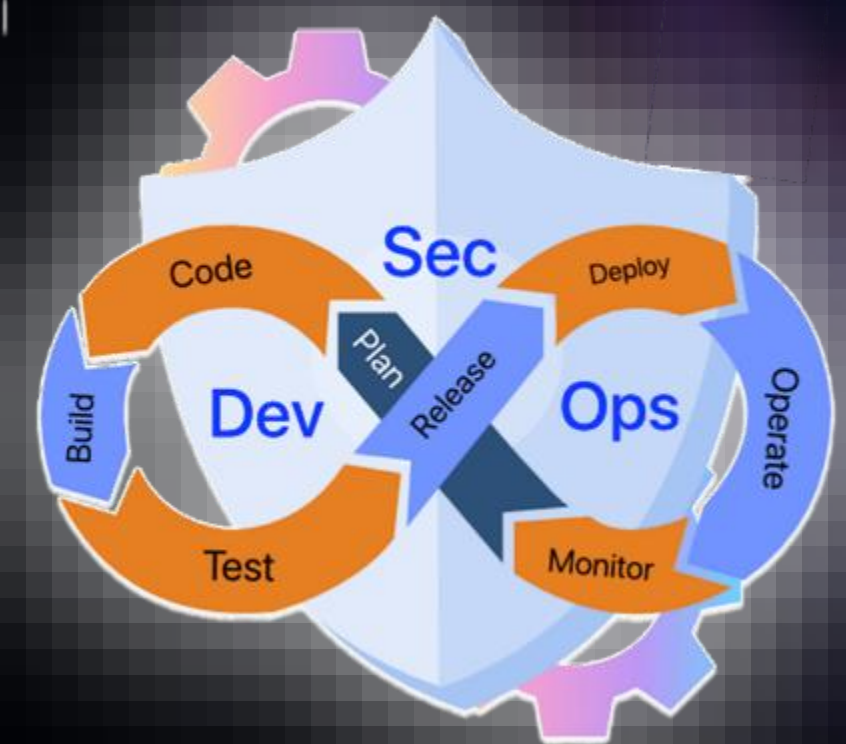

The two are deeply connected: intelligence guides hunters by providing hypotheses on where to look, while successful hunts generate new, internal intelligence about an attacker's behavior. This cycle strengthens an organization's overall security posture by reducing attacker dwell time.

DEVICE MANAGEMENT

our advanced threat detection and response platform designed to provide early visibility into endpoint security risks. See attacks sooner and start responding proactively with an always-on defence system that protects your endpoint suite.

EMAIL SECURITY

Email protection, such as: Phishing and Impersonation Protection, i Account Takeover Protection Domain Fraud Protection (DMARC) Spam, Malware, and Advanced Threat Protection

Our Range of Products:

SECIRON

Your journey, secured.

ITSM Tools

Today, many tools developed to help manage the ITSM

All processes in ITSM can be managed & operated using tools to automate and reduce complexity

Our product line for ITSM tools:

Enterprise Content Management & Digital Transformation Tools:

Our solution platform

ECM is an umbrella term that describes the combination of methods, tools and strategies that **support capturing and managing content**, as well as the storage, preservation and delivery of information throughout its lifecycle to **employees**, **business stakeholders** and **customers**.

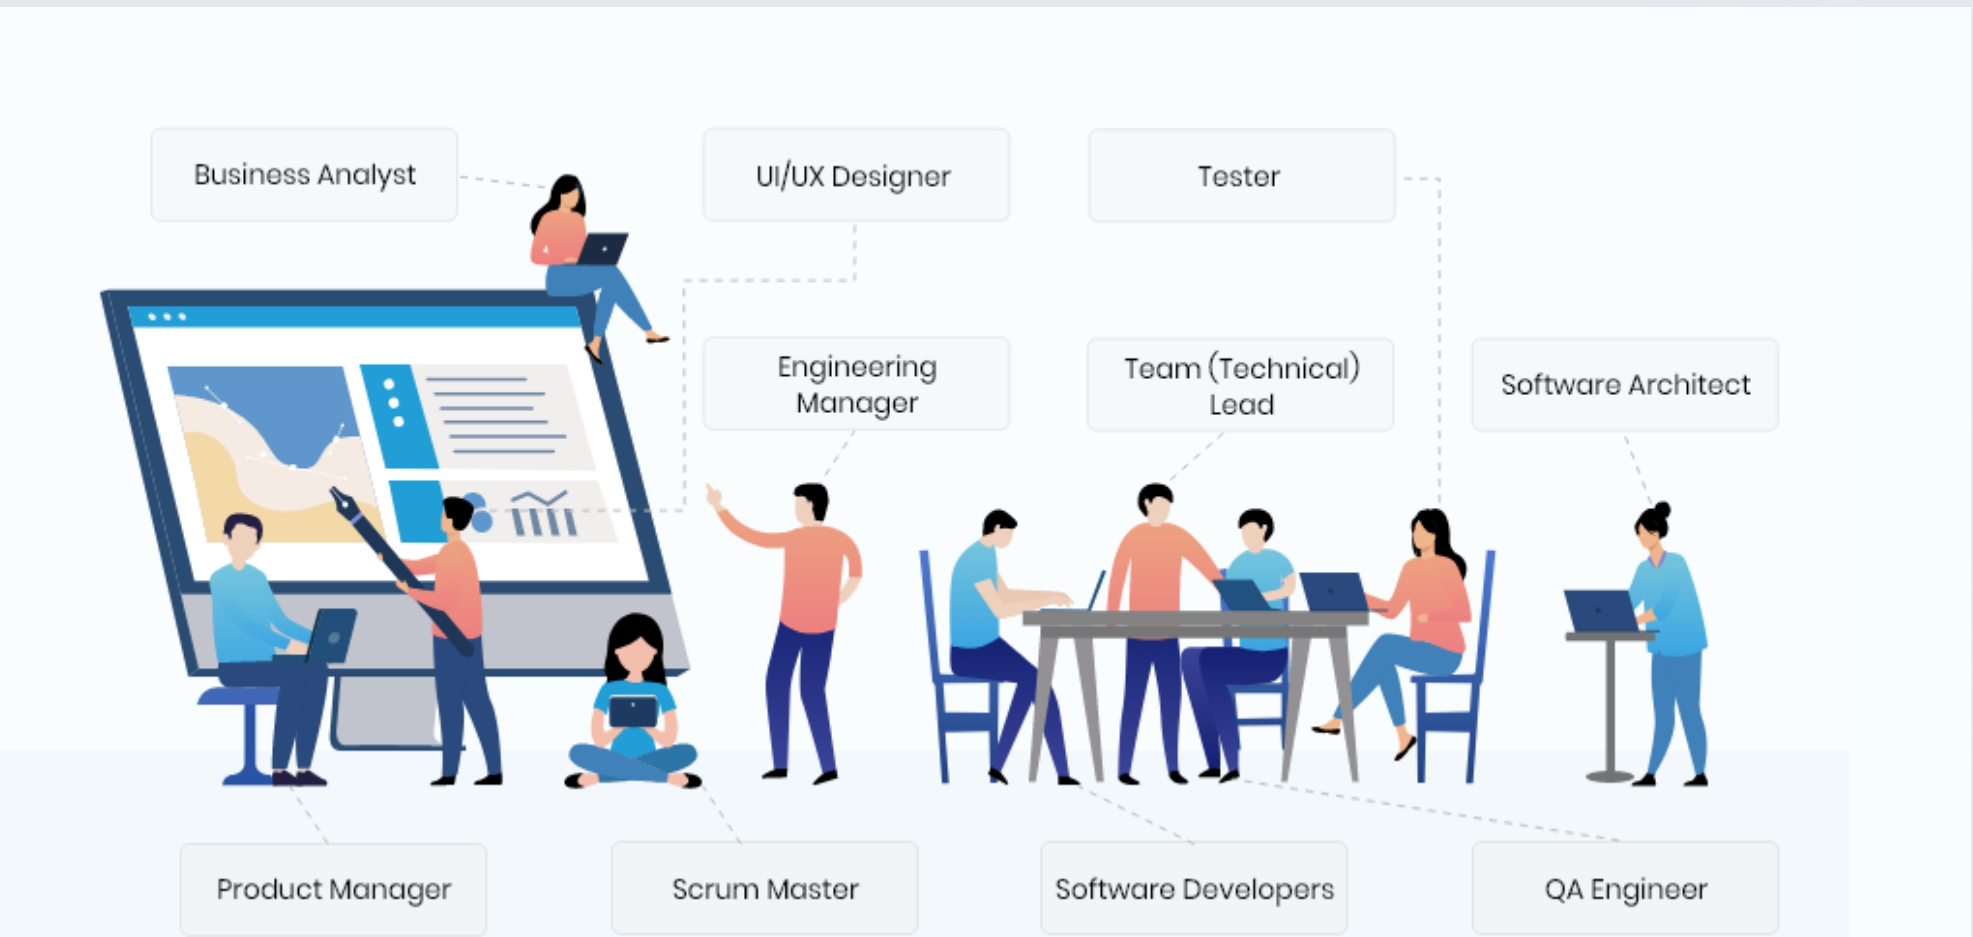

ECM software helps streamline the **lifecycle of information with document management** and the **automation of process workflows**. It is critical for any organization with large volumes of content to define an ECM plan to eliminate operational inefficiencies, reduce costs and adhere to **regulatory compliance** mandates.

This variety of information will be organized in a central location with **document metadata** stored in folders, ensuring the content is available to the right people at the right time.

Custom Development Solution

We provide solutions for your custom development software needs, with more than 20 developers

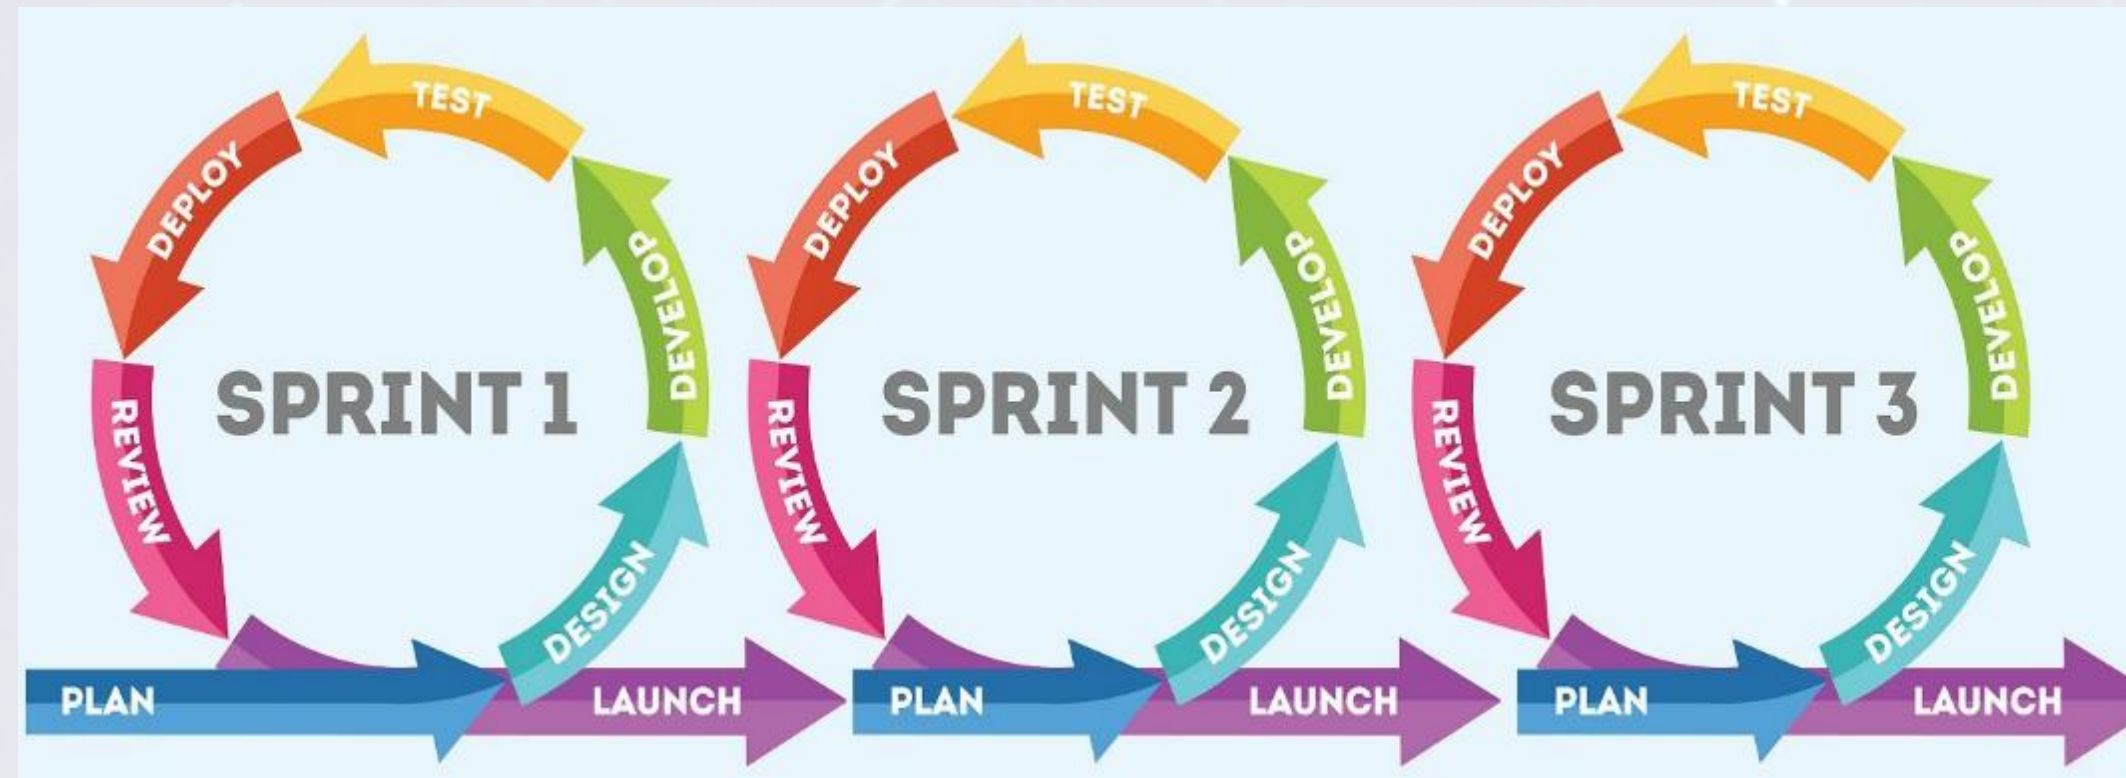

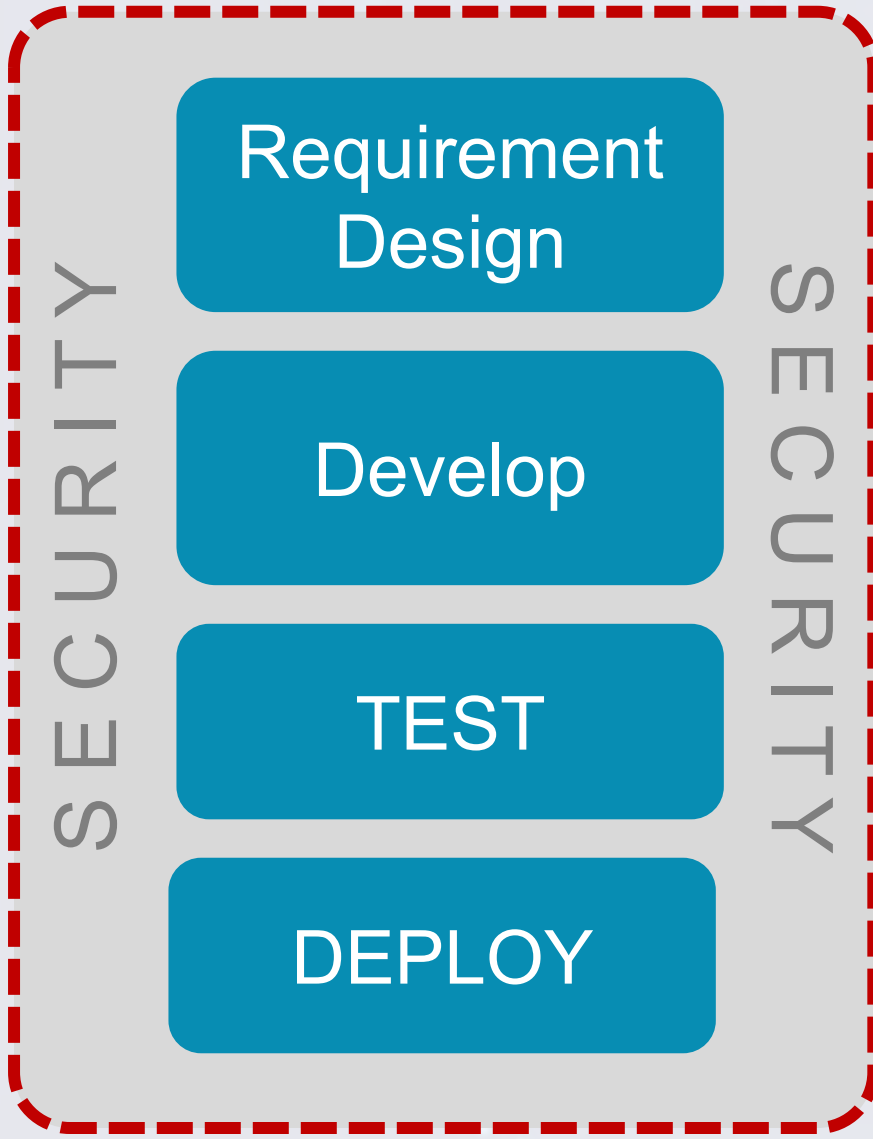

- **Language:** Java, Kotlin, Swift, SQL, Dart, .NET (C#, Visual Basic.NET), PHP
- **Web Design:** HTML 5, CSS, JavaScript
- **Framework:** Flutter, ReactJS
- **Database:** MSSQL Server, Oracle, MySQL, PostgreSQL
- **Microservices:** Container, Kubernetes
- **BPM:** Appworks

Waterfall

IMPLEMENTING SECURITY TO DEVELOPMENT PROCESS

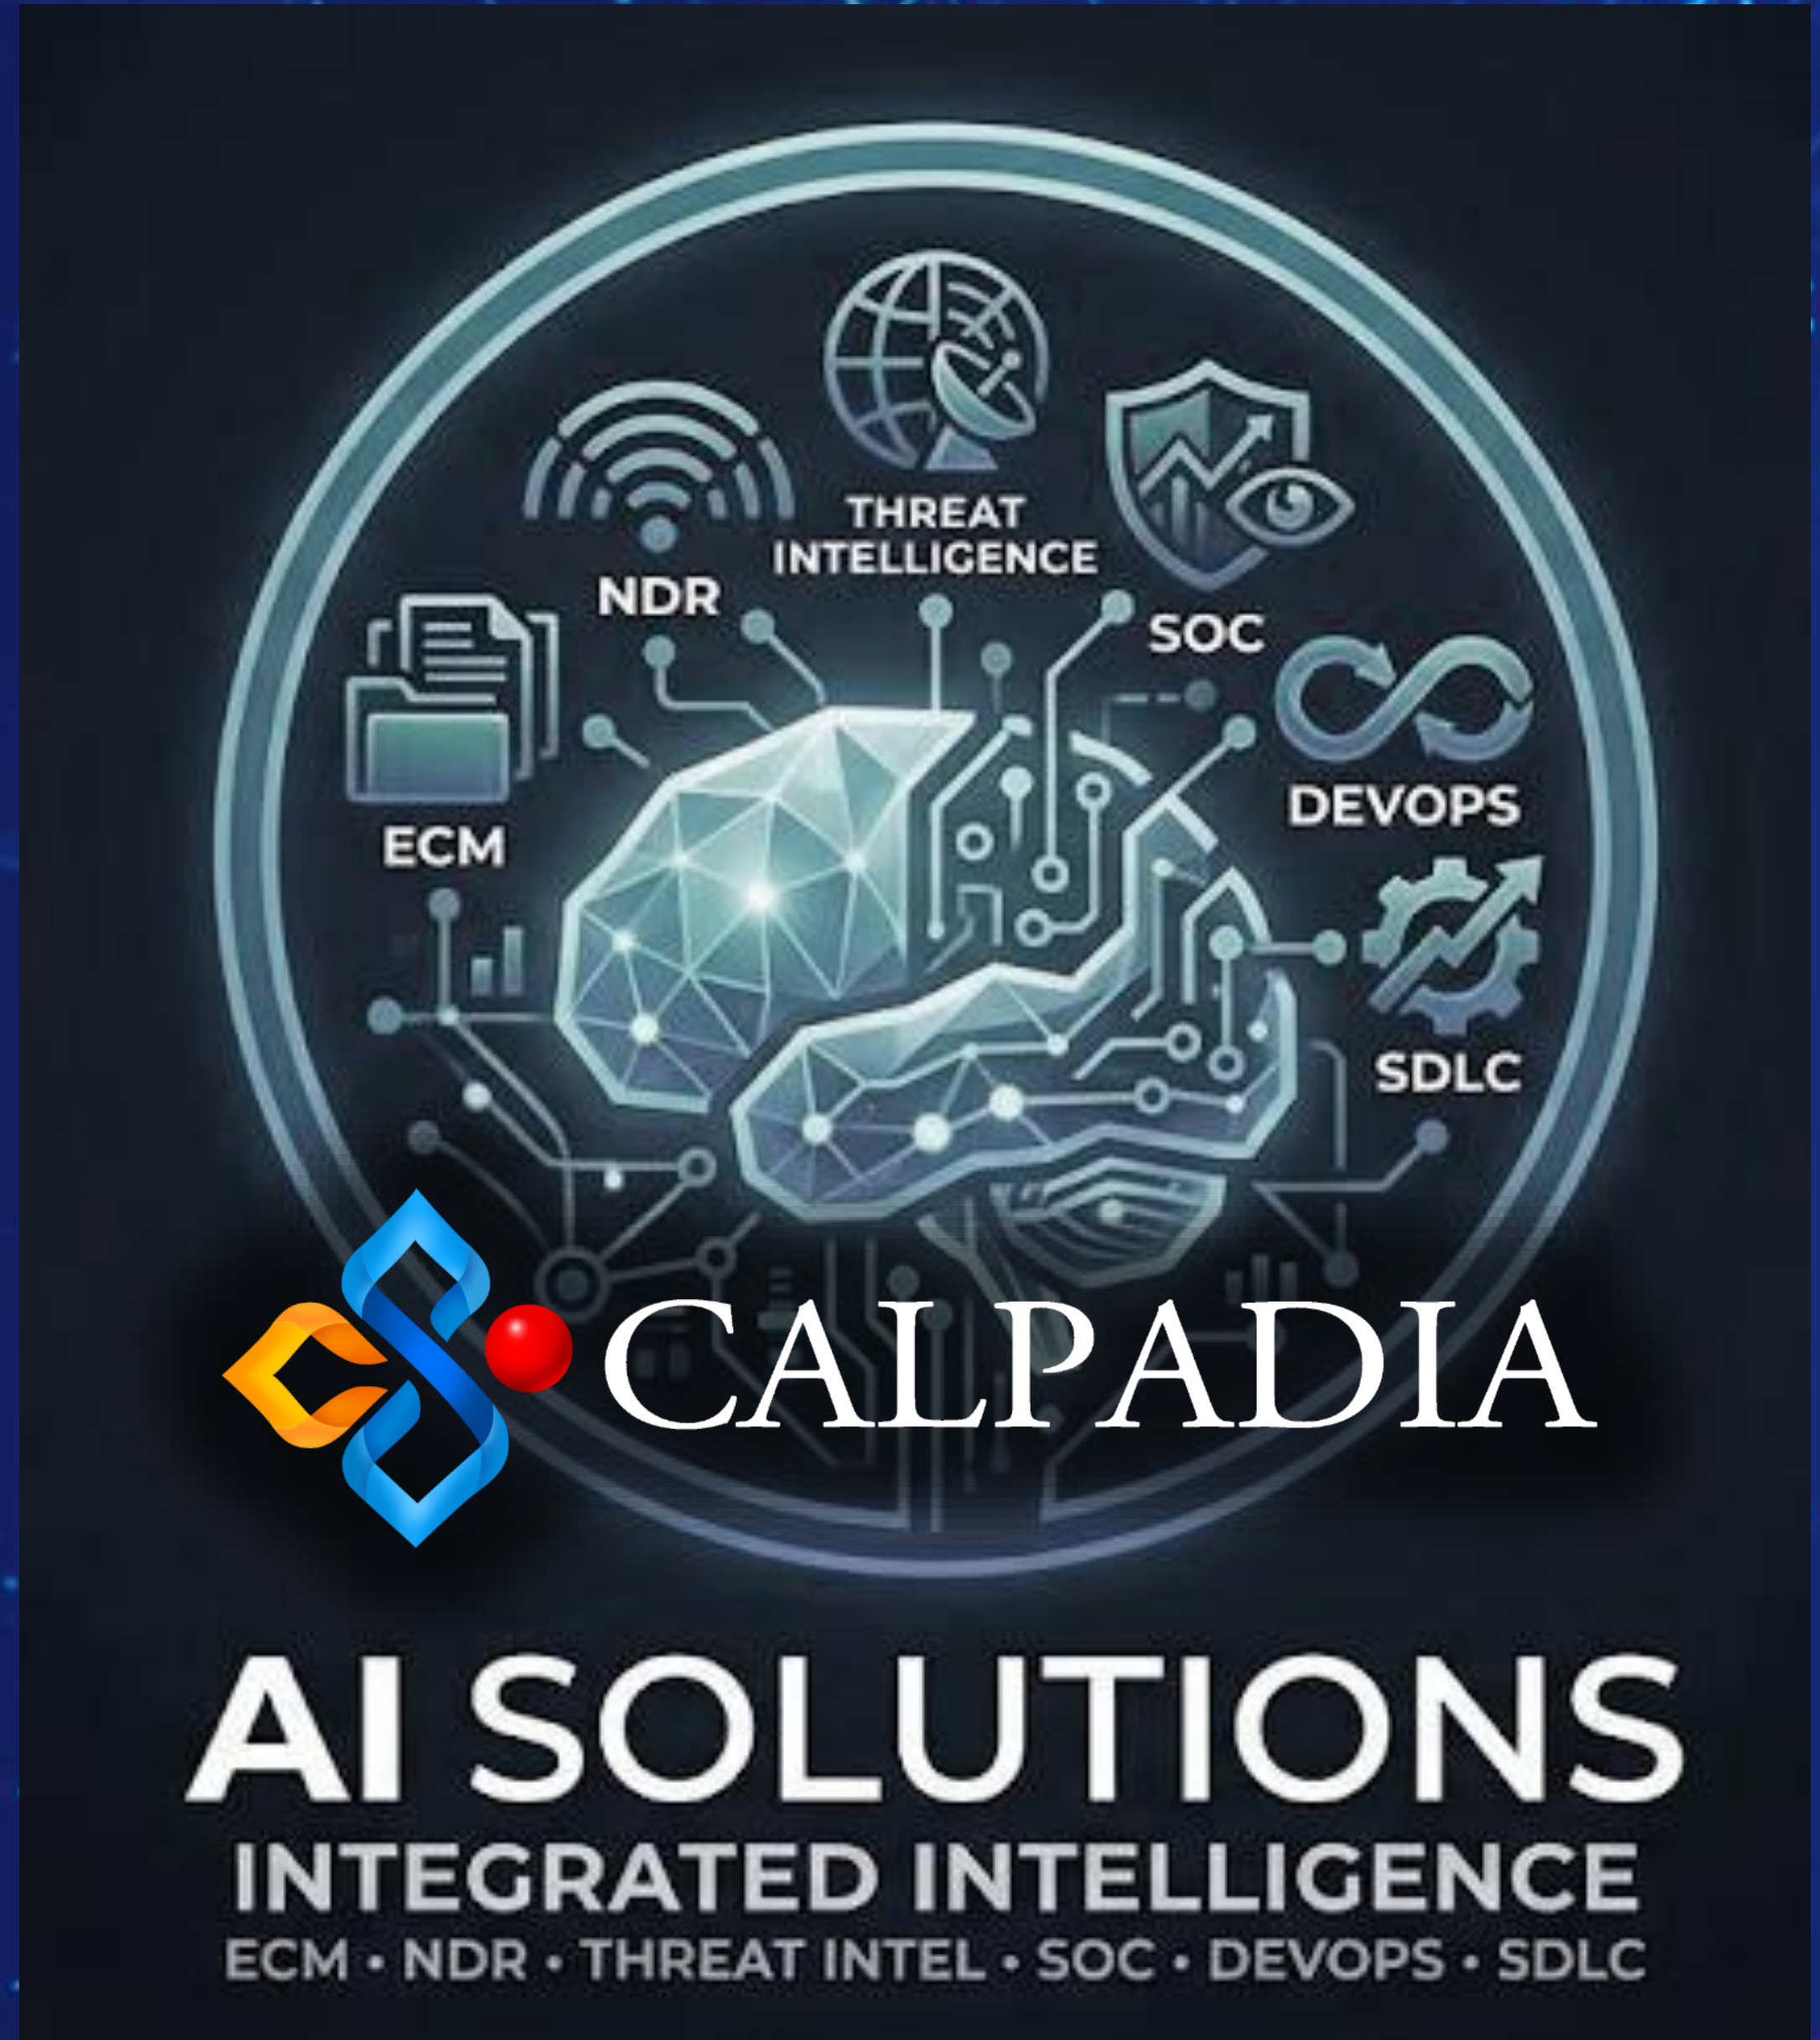

AI Embedded Feature to Enhance Our Solution

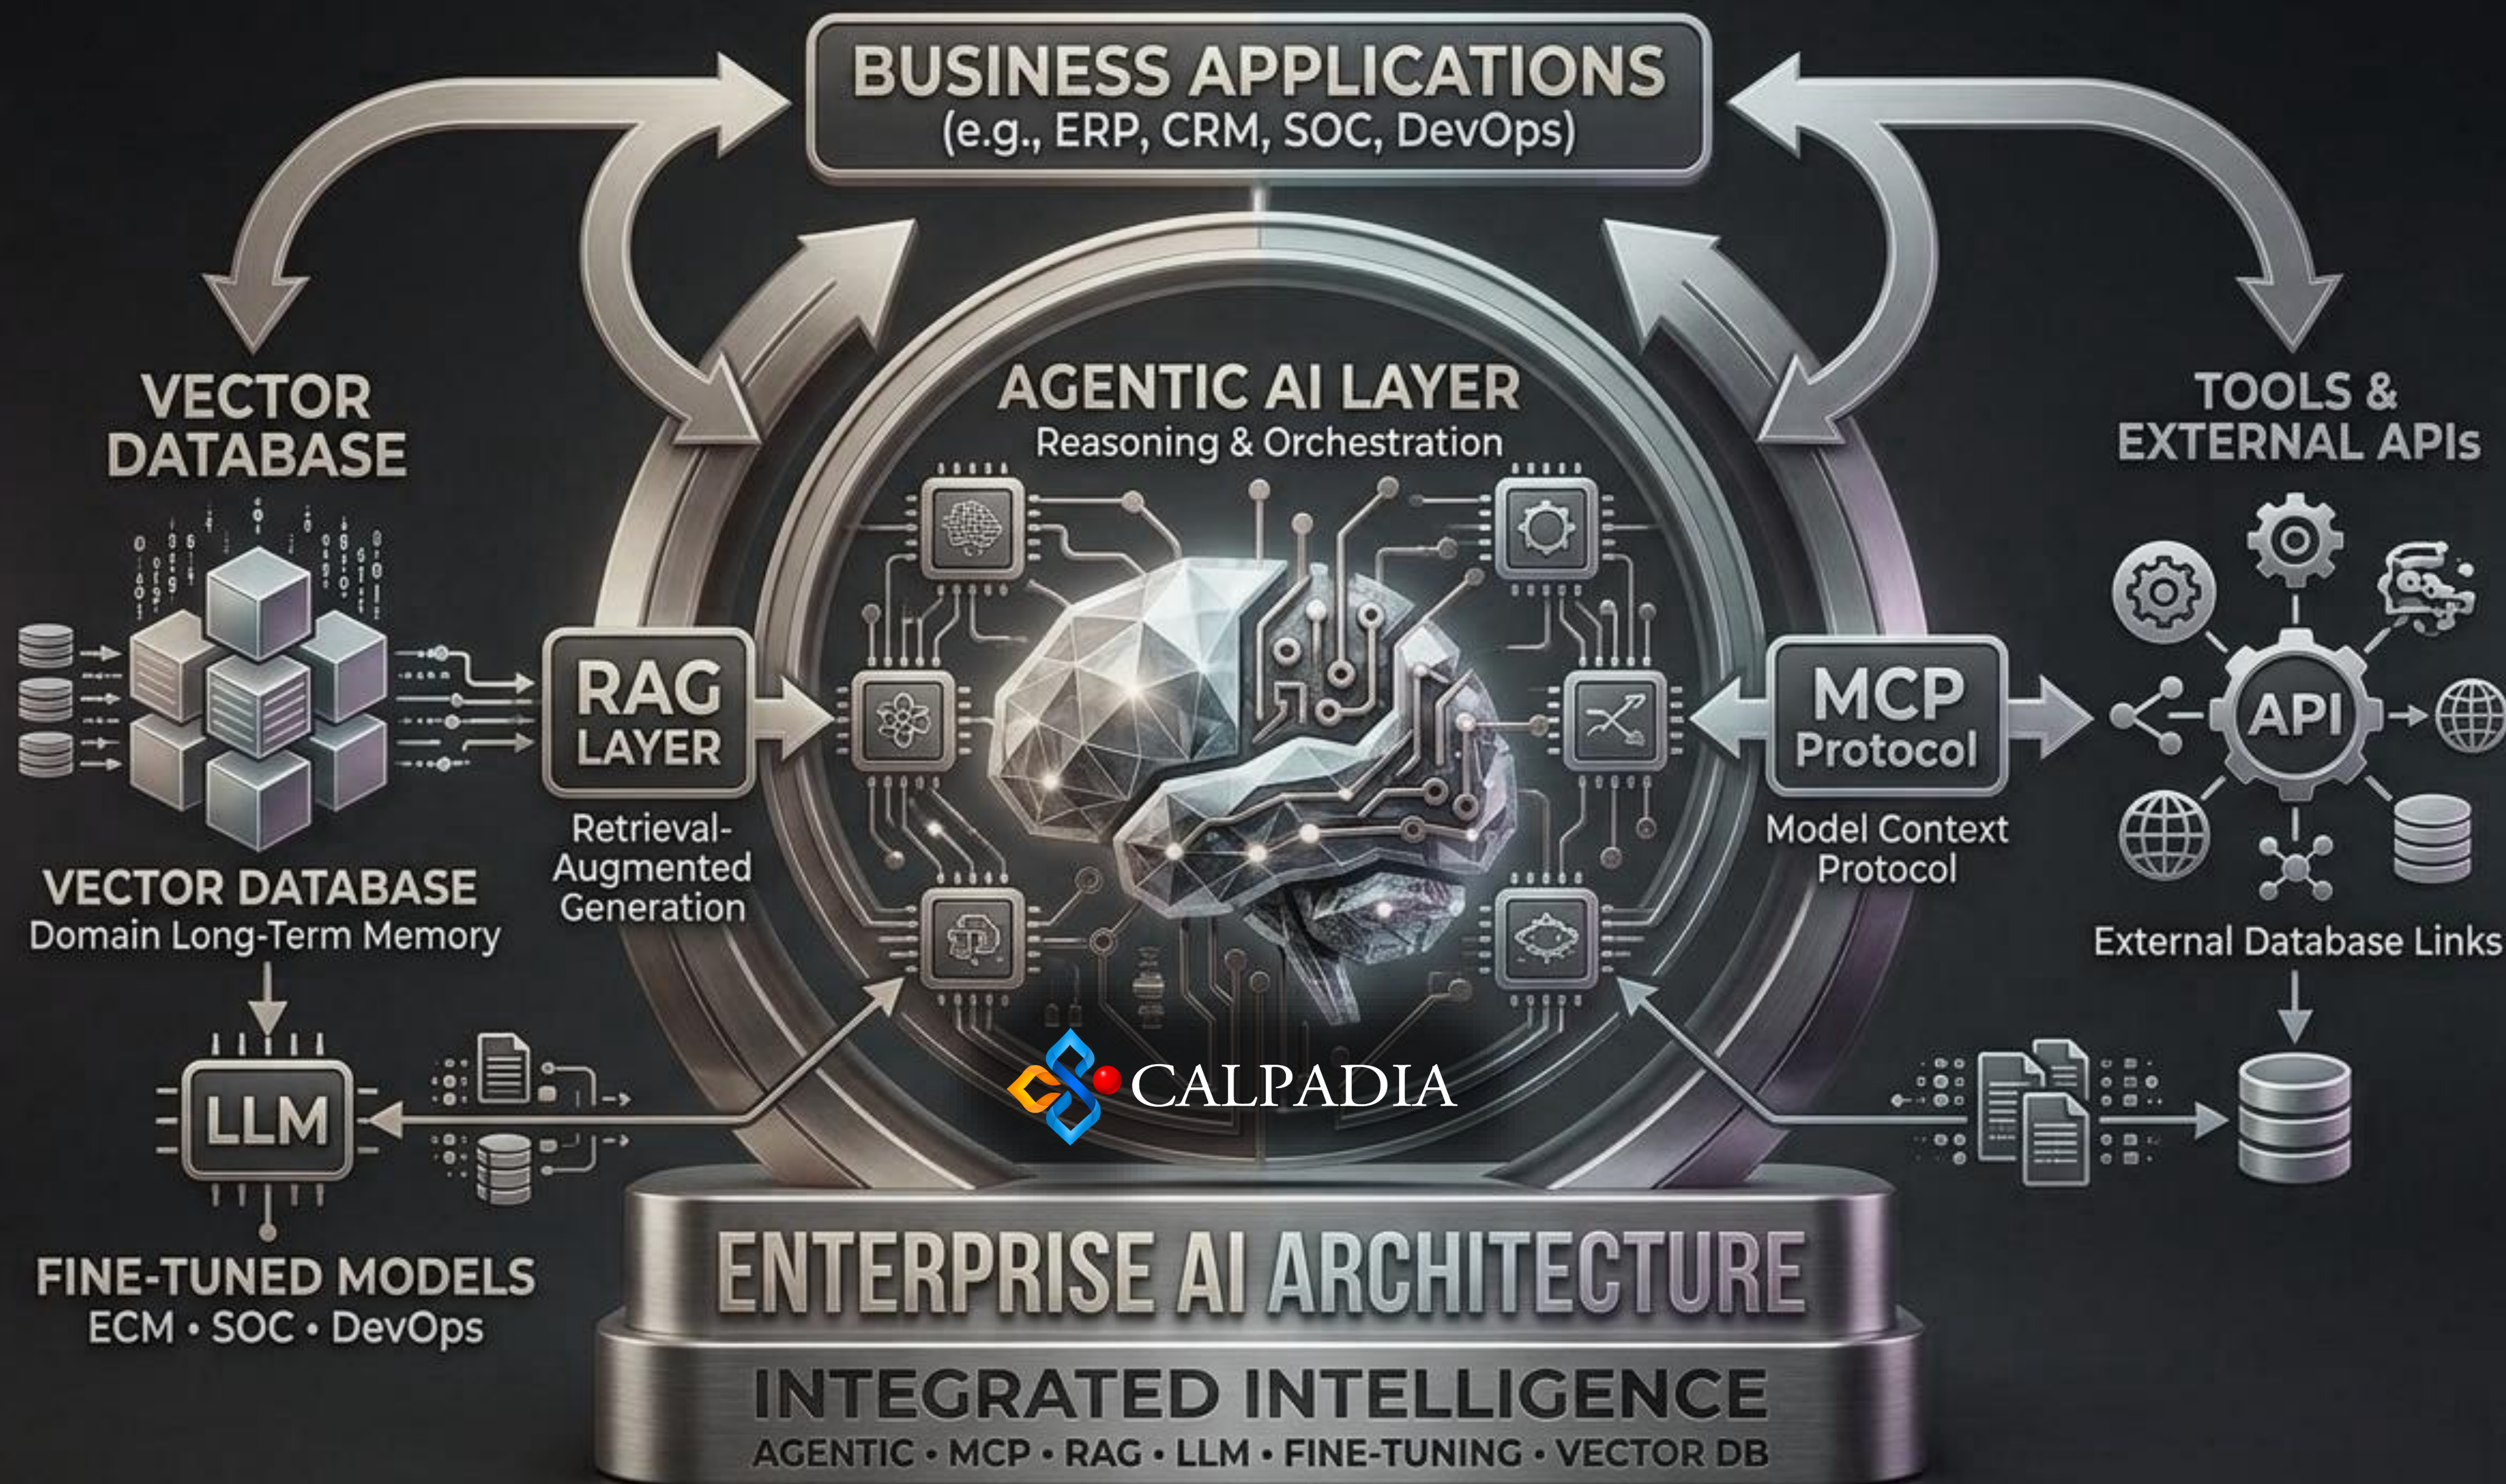

Integrating Artificial Intelligence across enterprise IT transforms how organizations manage data and defend against threats. Embedding machine learning across content, security, and development systems replaces manual tasks with automated operations, creating an agile ecosystem that accelerates software delivery while strengthening security.

- In Enterprise Content Management (ECM), AI automates document tagging and classification and with highly-accurate OCR.
- Network Detection and Response (NDR) uses behavioral analysis to flag real-time traffic anomalies beyond static rules. For security, AI empowers Threat Intelligence and Security Operations Centers (SOC) by processing massive feed volumes, triaging alerts automatically, and reducing incident response times.
- In DevOps and the Software Development Lifecycle (SDLC), AI assists developers with smart code completion, predictive CI/CD pipeline checks, and automated security scanning to catch vulnerabilities early.

Unifying AI across content management, cybersecurity, and software engineering reduces manual workloads, mitigates risks, and enables organizations to deploy secure software faster and more efficiently.

AI Solution Architecture

Customer References

Through consulting, implementation, and turnkey project management, CSI serves diverse sectors—including government, healthcare, e-commerce, and education—helping clients seamlessly merge business insights within a unified technological environment.

BANKING

FINANCE & INSURANCE

MANUFACTURING & PROPERTY DEVELOPER

OTHERS

- Custom Application Development & Maintenance Support
- Enterprise Content Management (Document Digitalization)
- Business Process Management/ Automation
- RFID & IOT Implementation
- Infrastructure (Server & Network) & ITSM Tools
- Security, EDR, NDR, XDR & DevSecOps
- Digital Signage, Collaboration Tools & Education

Looking forward for successfully business collaboration

THANK YOU!
